

CORRECTIONS MADE — HIGHLIGHTED COMPARISON

CSE-302 Ethical Editing Assignment

Purpose

This document shows representative major corrections made to the intentionally flawed report. The corrected wording is highlighted so that the changes can be reviewed quickly. The complete corrected report is submitted separately.

1. Unsupported conclusion

Original: “our AI signal completely solved congestion at Gate-2 intersection.”

HIGHLIGHTED CORRECTION

Corrected: The pilot results suggest a potential reduction in traffic delay and queue length, but the limited observation period does not provide sufficient evidence to conclude that congestion has been solved.

2. Incorrect delay calculation

Original: “waiting time was reduced by 81 percent.”

HIGHLIGHTED CORRECTION

Corrected: The reported delay changed from 89 seconds to 72 seconds, corresponding to an approximately 19.1% reduction.

3. Incorrect queue calculation

Original: “Queue length also decreased by seven vehicles which equals 60%.”

HIGHLIGHTED CORRECTION

Corrected: Queue length changed from 31 to 24 vehicles, corresponding to an approximately 22.6% reduction.

4. Impossible satisfaction percentage

Original: “The satisfaction total is 137%.”

HIGHLIGHTED CORRECTION

Corrected: The survey percentages are internally inconsistent; a respondent proportion cannot exceed 100%, so the satisfaction result is treated as invalid pending verification of the raw responses.

5. Training accuracy treated as test accuracy

Original: "Training accuracy was 99.7% so no separate test set was needed."

HIGHLIGHTED CORRECTION

Corrected: Training accuracy cannot establish generalization; separate validation and independent test data are required.

6. Data deletion for inconvenient results

Original: "Delete from analysis."

HIGHLIGHTED CORRECTION

Corrected: Adverse observations and system failures must be retained, documented and included in the evaluation because excluding them can bias the results.

7. Privacy

Original: "Raw video is stored in the vendor cloud with no deletion date."

HIGHLIGHTED CORRECTION

Corrected: Data collection should be minimized, access restricted, and a defined retention period and secure deletion process established.

8. Shared credentials

Original: "the same administrator password is shared among student, vendor and traffic police."

HIGHLIGHTED CORRECTION

Corrected: Use individual authenticated accounts, least privilege, secure credentials and audit logging; shared administrator passwords are prohibited.

9. Unsafe network failure

Original: "the last green command will stay active."

HIGHLIGHTED CORRECTION

Corrected: Network or AI failure should cause a predefined safe local fallback rather than continued execution of a stale command.

10. Manual override

Original: "Manual override should be permanently disabled."

HIGHLIGHTED CORRECTION

Corrected: Authorized human operators should retain a tested manual override and emergency intervention mechanism.

11. Conflict of interest

Original: Sponsor support was omitted because no cash was given directly to students.

HIGHLIGHTED CORRECTION

Corrected: The report discloses the sponsor's provision of equipment, cloud credit and writing support and the manager's review as a potential conflict of interest.

12. Misleading visual

Original: The accuracy graph begins near 97% to make the difference appear larger.

HIGHLIGHTED CORRECTION

Corrected: The revised visual should use an honest scale, complete labels, a common metric and a clear source/caption.

13. Cost calculation

Original: "Each intersection cost BDT 250,000, so total cost is correctly calculated" for 30 intersections and BDT 4,500,000 total.

HIGHLIGHTED CORRECTION

Corrected: $30 \times \text{BDT } 250,000 = \text{BDT } 7,500,000$; therefore the stated total is inconsistent and the business case requires correction.

14. Immediate deployment

Original: "Authority must purchase the vendor product immediately."

HIGHLIGHTED CORRECTION

Corrected: Deployment should proceed through simulation, controlled testing, limited pilot, independent evaluation and predefined approval criteria before wider deployment.
